

URBAN SCALE_ URBAN GAP

There are gap sequences in the Master Plan going from the private ambit to the public areas. We consider that those sequences order and scale the city, creating valuable transition zones.

The urban space qualities are found in the scale associated to their use, the private domain is the beginning of a long way which goes through different privacy stages and urban relations.

Our proposal demands that formal situation, using the following inputs, constructive systems, routes, spatial sequences, human scale... to develop our project.

The technology associated to the traditional constructive systems produce that the final built volume is the result of the conjunction of both of them. Ceramic has qualities traditionally related to the bioclimatic architecture, its bearing capacity and constructive versatility and thermal inertia.
